Correio Address Validation Server

Clean up your member address database, prevent fraud

Don't lose another member to a bad address. Our address validation system, Correio AVS, provides the ability to keep your member address database accurate and up-to-date.

Correio AVS harnesses the power of the United States Postal Service Address Matching System database of every address in America to ensure that your credit union's member information remains as accurate as possible. Our product's real-time, multi-point integration into Symitar's Episys™ system allows credit unions to validate and standardize addresses at the point of entry to help reduce fraud, postal costs, and ensure that member address data is as accurate as possible.

"Correio has been the perfect method of getting a member's address into the database correctly the first time. If Correio cannot verify the address, then you still have the opportunity to let the member know right there. You don't have to waste postage to find out you have an undeliverable address."
